# Agricultural and Forest Landscape in Garrotxa

# The cultural evolution of the Landscape

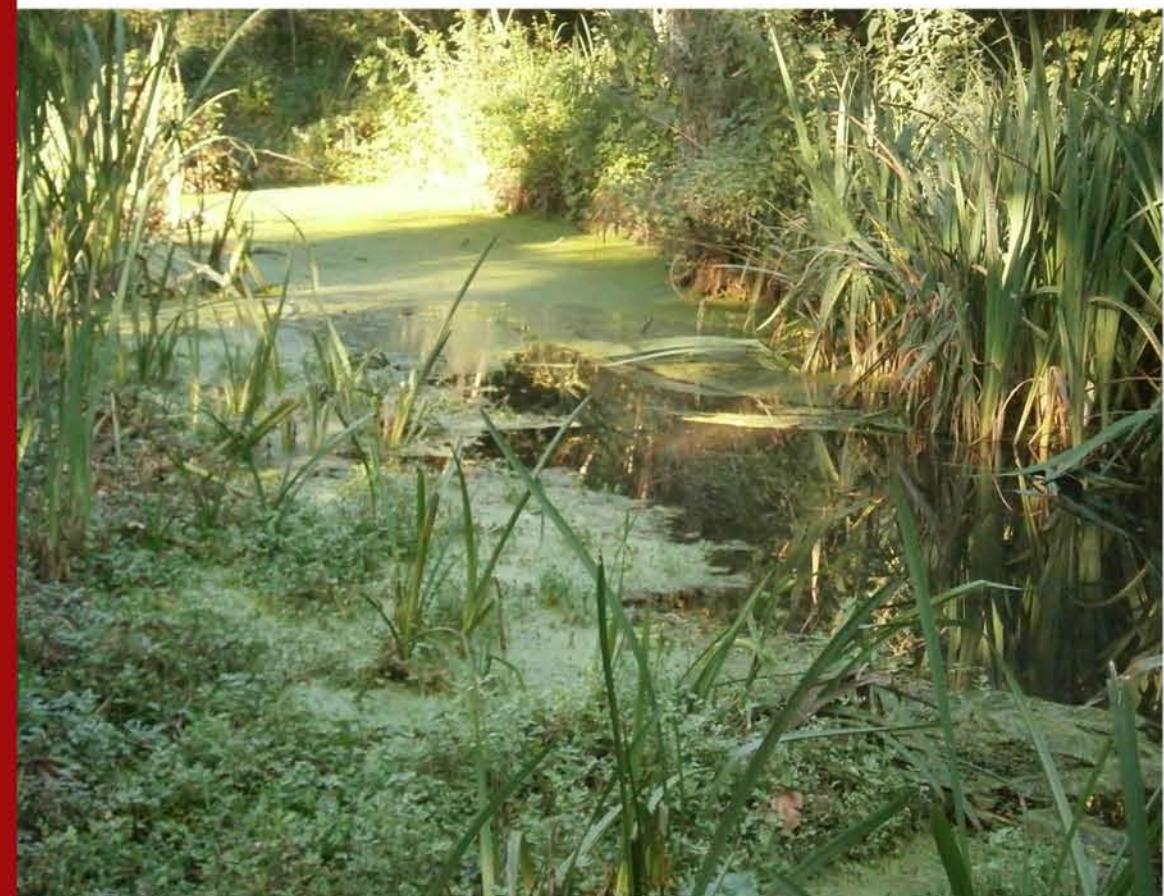

*Desde lo alto de esta cordillera se descubre la Plana de Bas, [...] cercada de altas montañas, con lo cual, y del color de la flor de fajol, de que toda ella está sembrada, parece un gran lago.*

Francisco de Zamora, 25th August 1787

*Des del cim de Montsacopa ens miràvem amb bona ullera tota la cordillera espadada que enclou les riallares valls olotines, muntanyes emboscades de dalt a baix, d'un verd d'esmeragda.*

Carles Bosch de la Trinxeria, 1892

# The cultural evolution of the Landscape

- S** - specificity of volcanic landscape (geomorphological, ecological and visual values)
- existence of a management system for natural protected areas
  - good access to panoramic views through paths and itineraries
  - architectural heritage
  - traditional artistic and cultural activities
  - existence of territorial traditions and identities linked to singular villages
  - Highly people landscape awareness
- 
- fluvial historic infrastructures
- 
- agricultural products with quality labels
  - agricultural mosaic landscape (chromatic differences)
  - high value of the agricultural land (mainly in Vall d'en Bas) connected to the volcanic soil characteristics
  - high value orchards
  - conservation of typical stone dry walls
  - high exposure to sun light
- 
- High natural value of forest (74% of la Garrotxa)
  - Forest surface prevent soil erosion

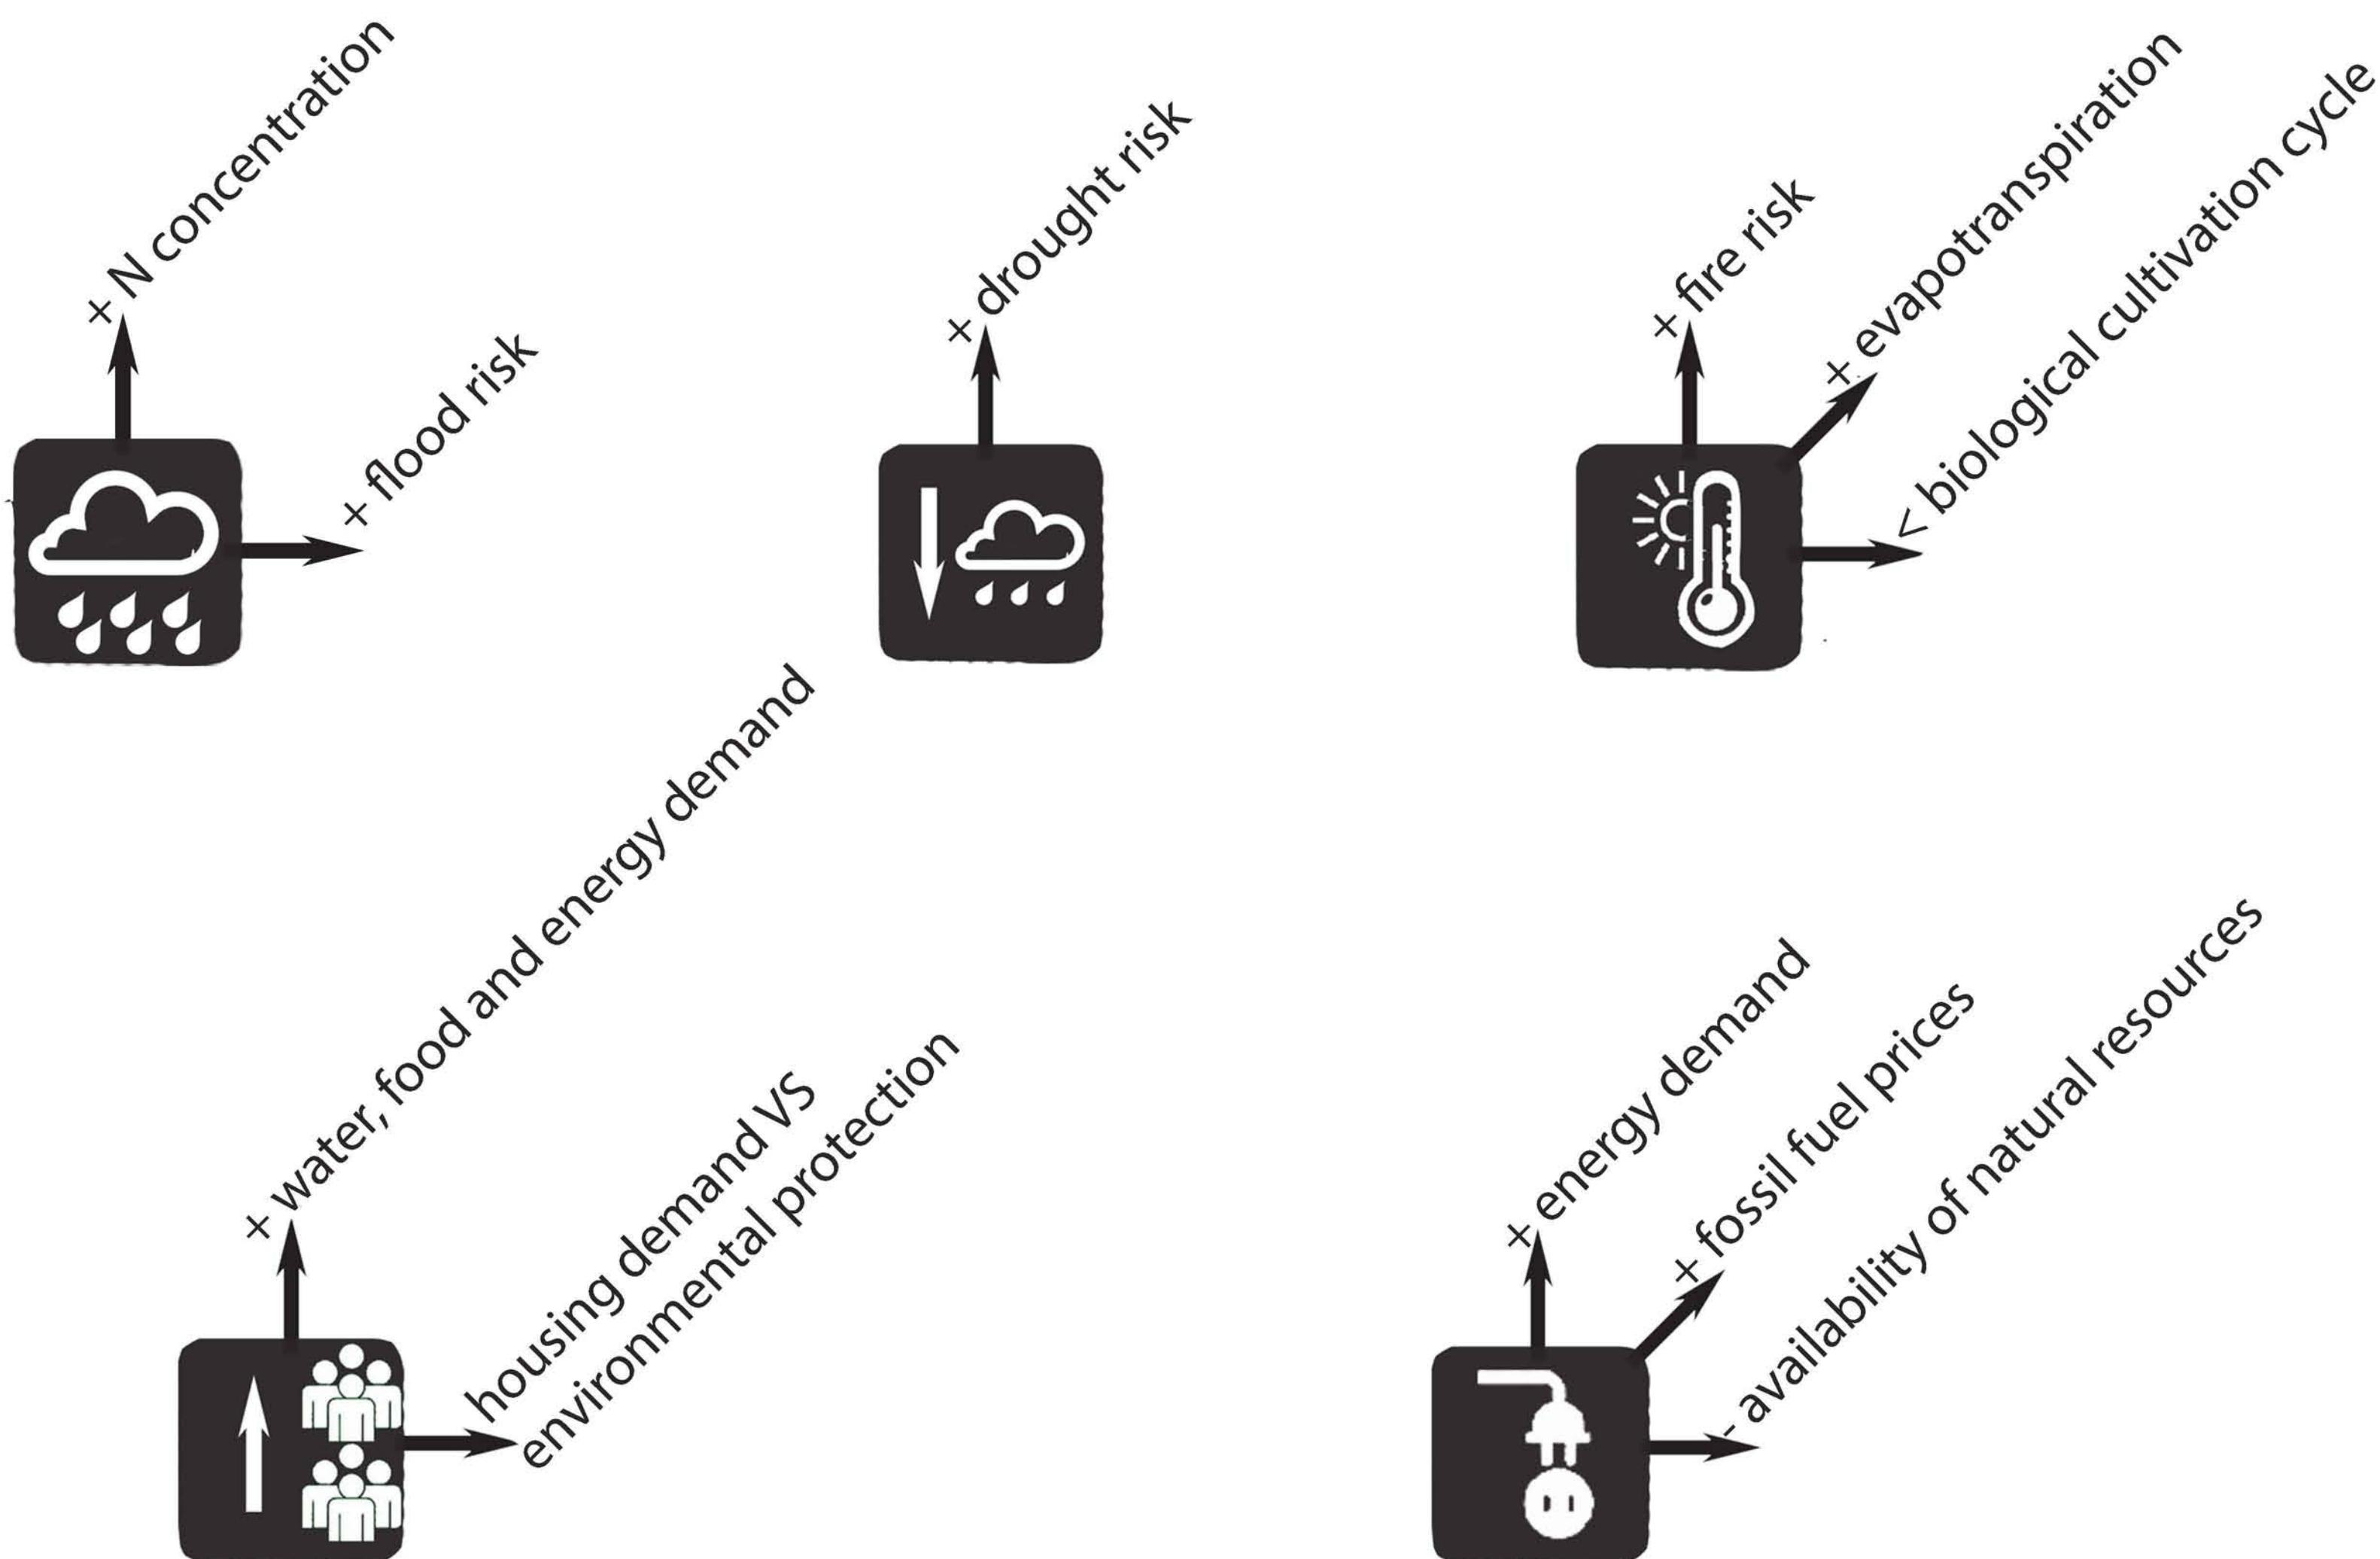

- W** - Volcanic soil characteristics do not allow intense edification
- Olot urban sprawl/infrastructures conflict with natural protection objectives
  - Increases in industrial and commercial land uses
  - Rural abandonment: already 500 abandoned masies
- 
- Fluvia's water capacity is not sufficient for hydroelectric energy production
- 
- Abandonment of traditional agricultural schemes, which are less productive -> higher water demand
- 
- General decrease in agricultural land use
  - Abandonment of peripheral agricultural lands
  - Homogenization and intensification of flat agricultural lands
  - Increase in the size of parcels of agricultural lands & loss of aesthetic value because of homogenization;
- 
- uncontrolled forest land growth

- O** - Highly people landscape awareness -> land stewardship
- promotion of landscape values by the natural park management authority
  - existence of higher-level territorial planning dealing with landscape protection.
- 
- enhance local agricultural production in response to increasing transportation costs
  - further promotion of local high quality food to cope with domestic and external demand -> maintain traditional agricultural landscape
- 
- development of agro-tourism
  - Intensification of the commercial network through infrastructural development.
  - increase in agricultural energy production linked to EU subsidies
- 
- increase the amount of biomass production as alternative to fossil fuels

- T** - Possible increase of road infrastructures which could break off the ecological continuity within the protected areas
- Further expansion of urban land -> isolation of natural protected areas
  - Further rural abandonment
- 
- decrease Fluvia's water capacity (until -25% under the worst possible conditions by 2050)
  - increase of water demand for domestic and agricultural purposes
- 
- Strong dependence of agricultural productive choices on EU subsidies -> Further abandonment of traditional agricultural schemes
  - Intensive agricultural schemes can increase the Nitrogen soil and water concentration
- 
- Increase risk of insect plagues due to homogenization
- 
- increased fire risk due to longer drought periods

# The cultural evolution of the Landscape

	Severe Scenario	LESS SEVERE Scenario
Temperature	+1.2 C°	+0.8 C°
Population growth	+ 20%	+ 8%
Precipitations	- 12/15% [+750 mm/year; +1250 mm/year]	-5/7% [+500 mm/year; +1700 mm/year]
Annual rainfall intensity variation		
Energy	+8/10% of energy demand	+4/5% energy demand

## Objectives

- \_develop cultivation patterns capable of **adapting** to new climate conditions
- \_improve the **quality of surface and groundwater** through sustainable agricultural systems, also considering the decreasing water availability in the long run
- \_promote **multifunctionality** of the landscape in order to increase the adaptation capabilities of the territory
- \_develop specific measures to face up increased **energy and water demand**
- \_promote a sustainable **forest management**, capable of facing the increase in fire risk and to its potential in energetic terms

## Strategies

1\_Strengthen proximity agricultural production and spread hort urbà

2\_Diversify Agricultural production and promote traditional cultivation and productive schemes

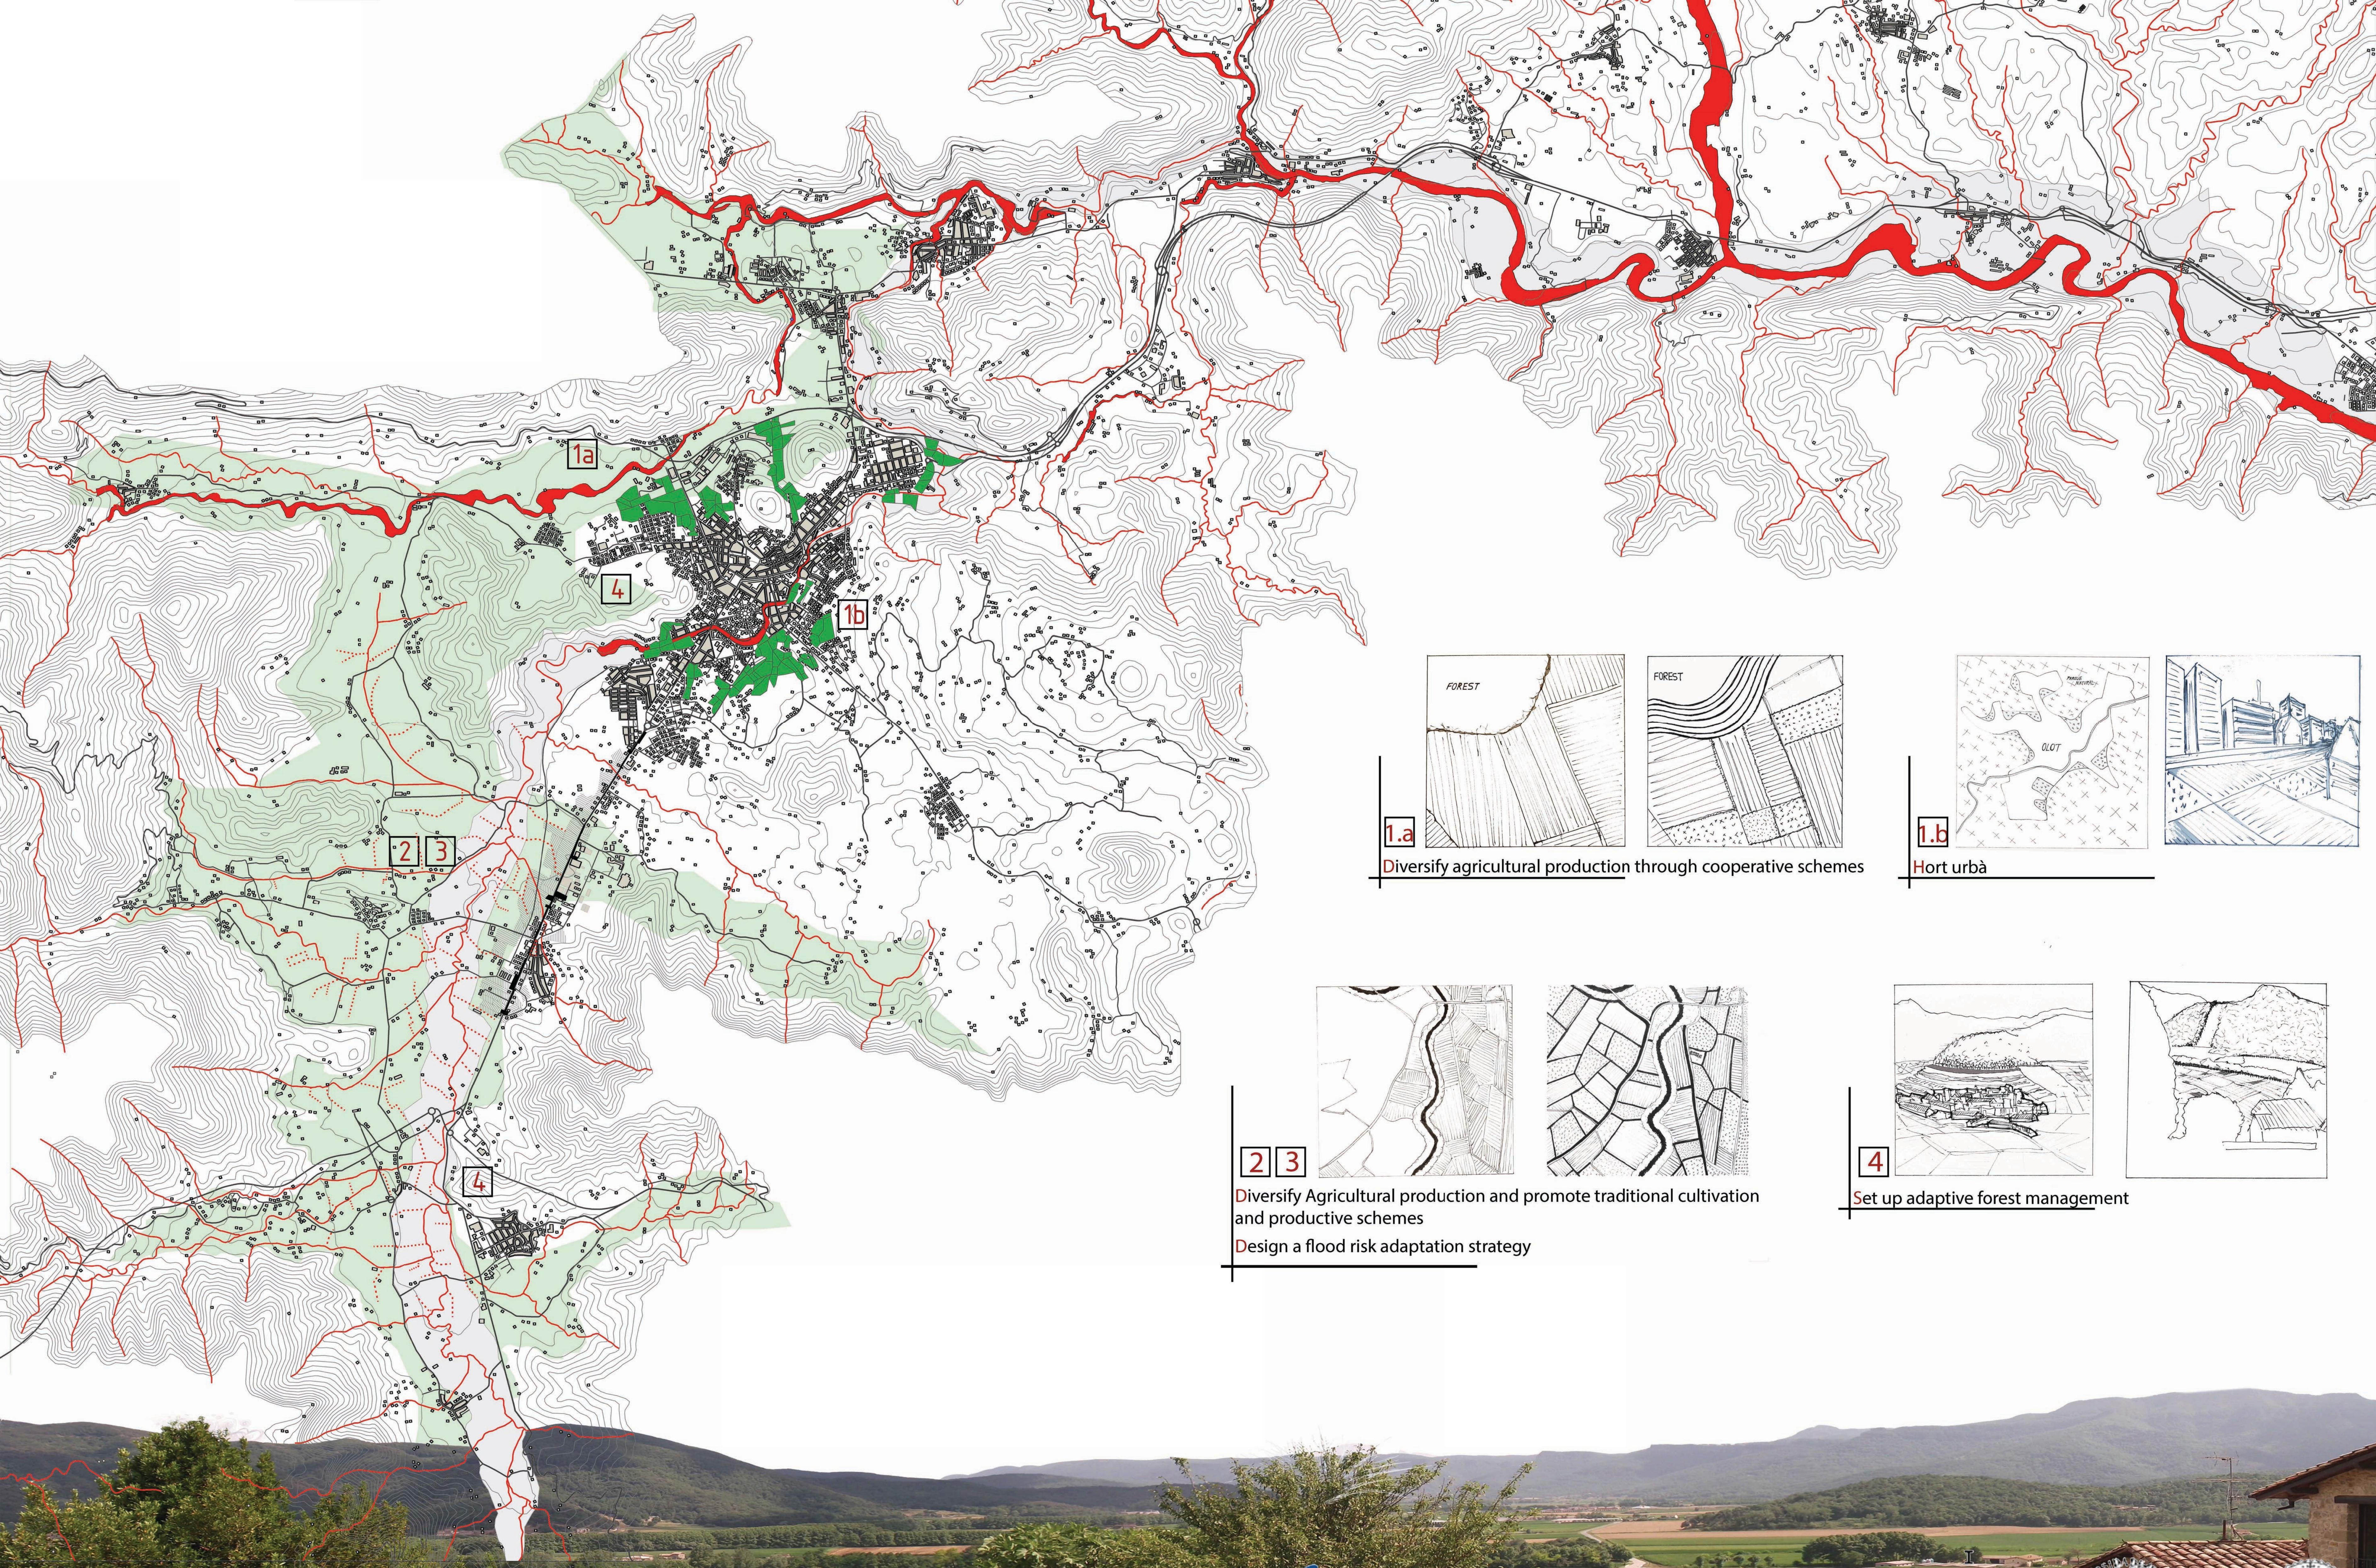

3\_Design a flood risk adaptation strategy

4\_Set up an adaptive forest management

\_urban sprawl

\_infrastructural system/landscape management

## Strengthen proximity agricultural production and spread hort urbà

\_Proximity agricultural systems will introduce **higher diversification** in land use, thus increasing the ecological and landscape values. Indirectly, it will also lead to reduce rural abandonment.

\_They will allow to **save energy**, by decreasing transport costs.

\_They will allow to **save water**, through the re-discovering of traditional productive schemes.

\_It will increase the local **self-sustainance**, by increasing local food supply and thus diminishing the dependence from EU subsidies.

\_The spread of **urban orchards** will allow to better integrate urban and agricultural landscapes, to improve the quality of peri-urban areas and to provide mitigation for climate change.

## Specific actions/activity proposals

\_support of a **cooperative scheme**, which will have to include the involved stakeholders (farmers, cattlemen, community inhabitants, land owners, cooperatives, food productors, consumers);

\_enhance **communication** with expertize (Landscape Observatory, Academic Institutions)

\_promotion of urban orchards in **public land**.

1

Strengthen proximity agricultural production and spread hort urbà

higher diversification

communication

public land.

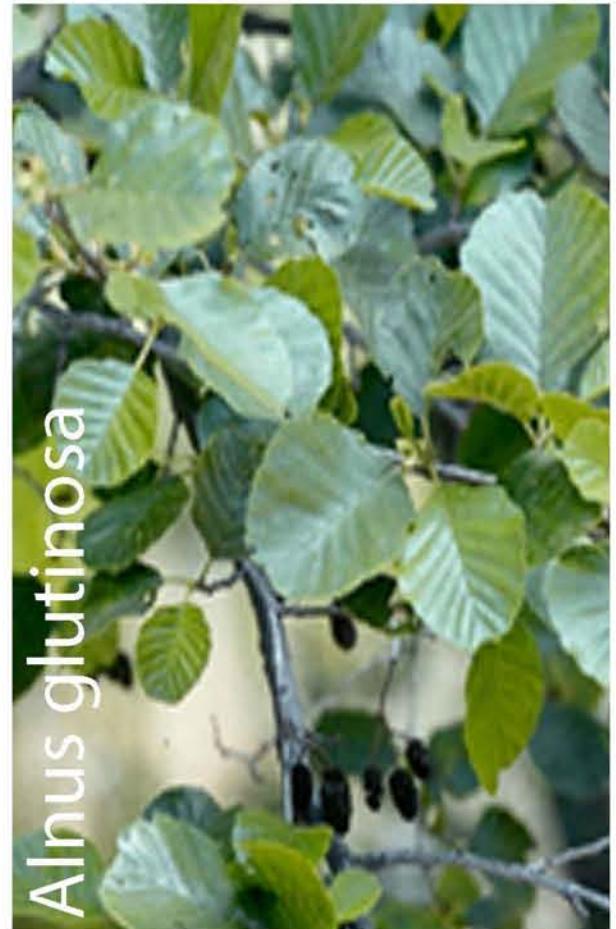

**1.a**

Diversify agricultural production through cooperative schemes

## Reintroduction of traditional cultivations

### Riparian vegetation Vall d'en Bas

*Alnus glutinosa*

*Salix alba*

*Populus nigra*

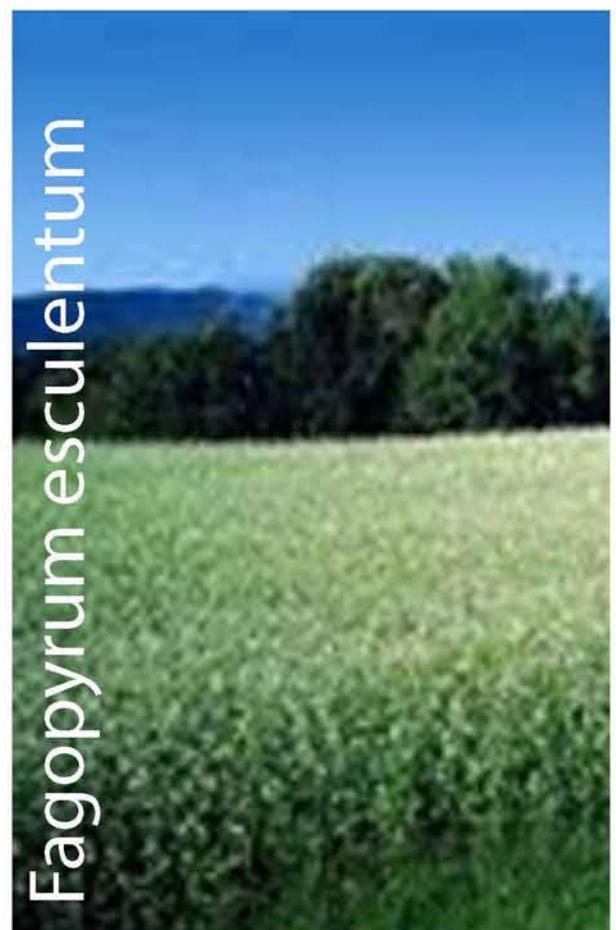

*Corylus avellana*

*Fraxinus angustifolia*

### Terraces cultivation and herbal plants Vall d'Olot

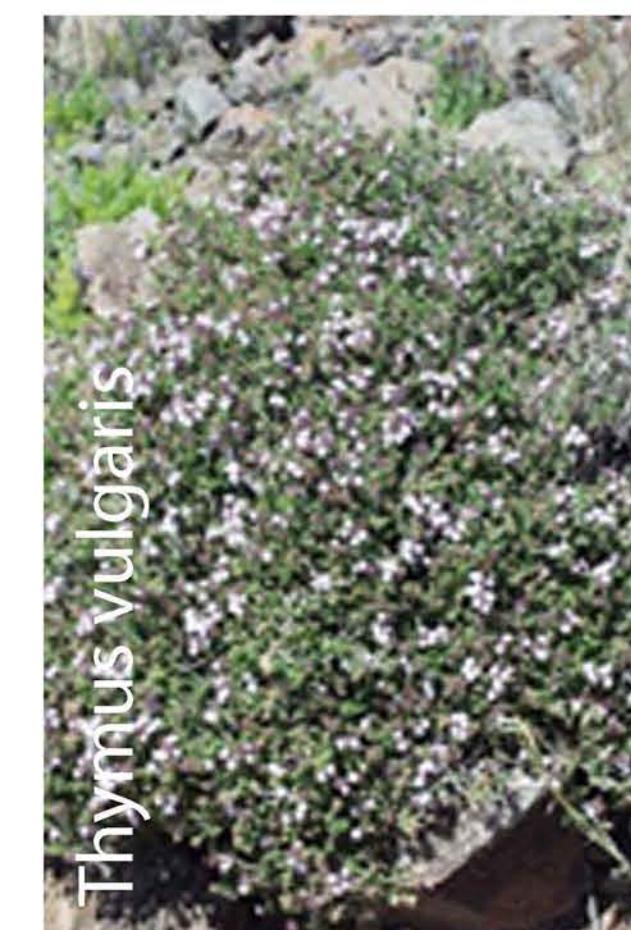

*Fagopyrum esculentum*

*Medicago sativa*

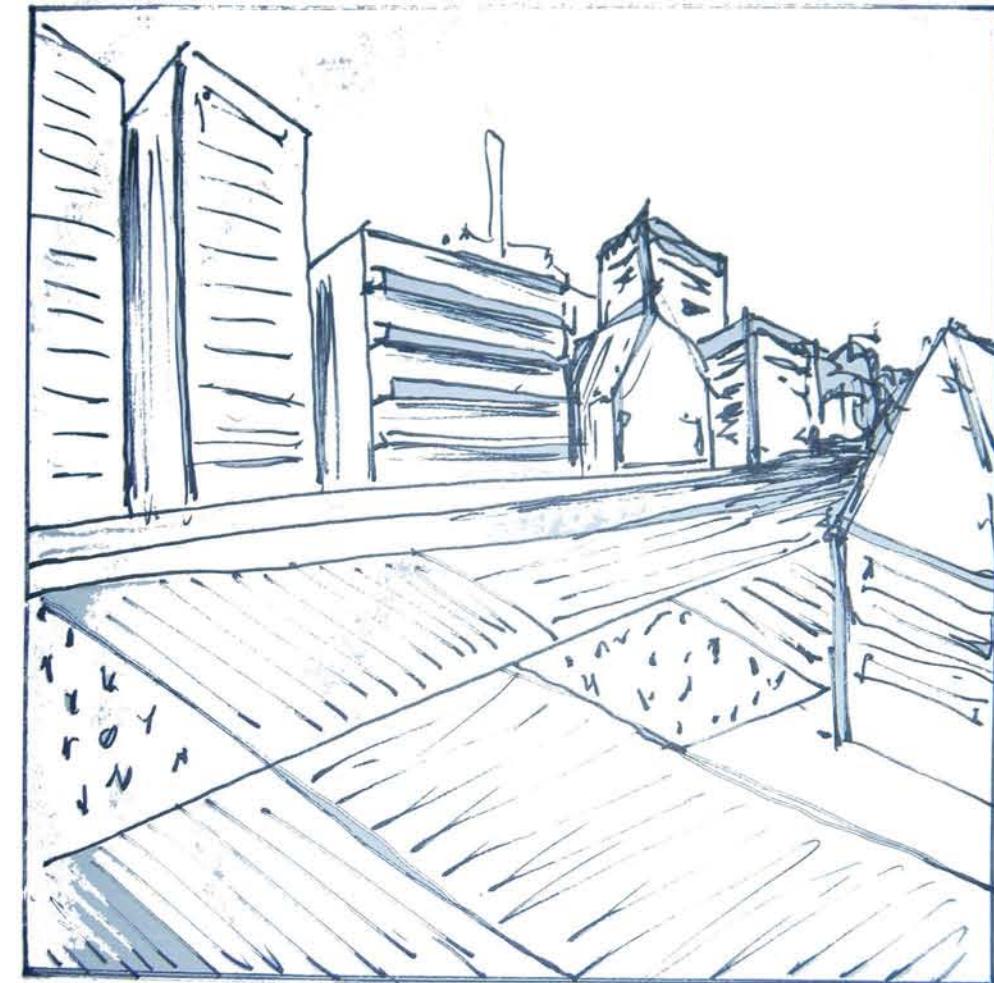

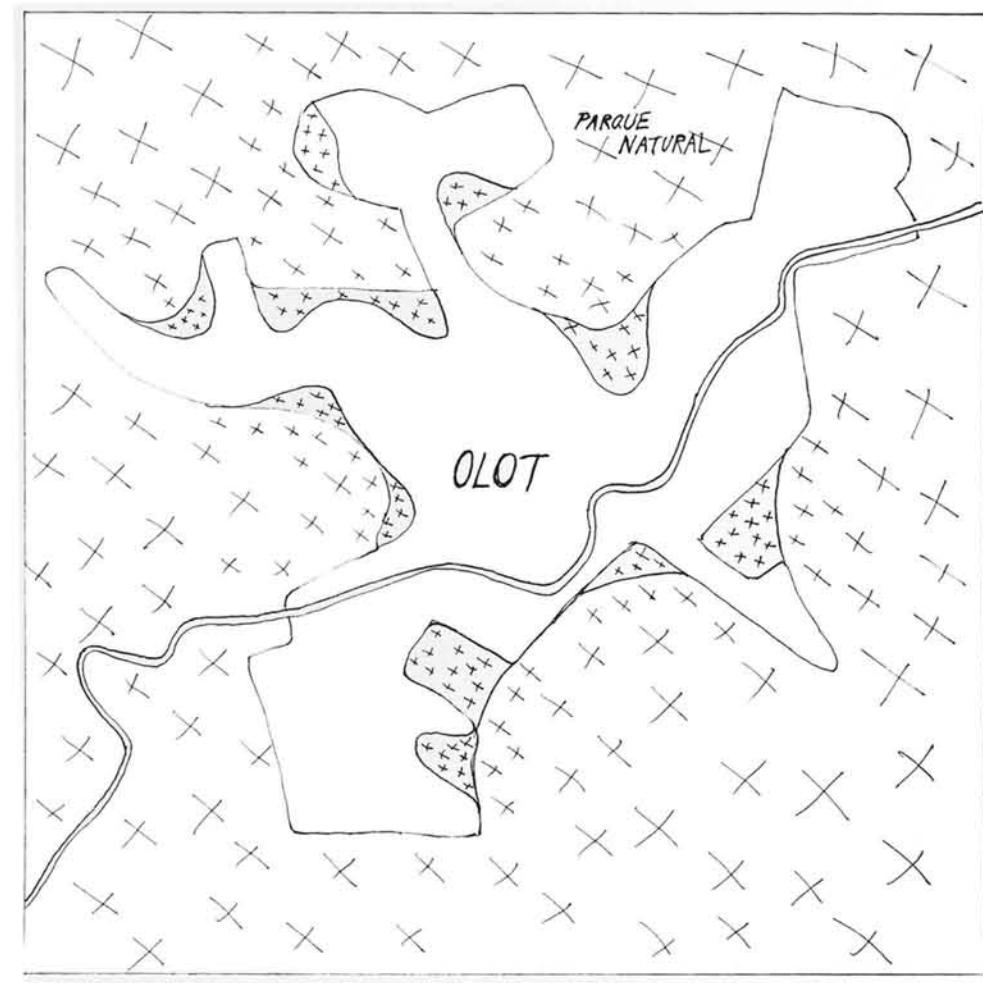

*Rosmarinus officinalis*

*Thymus vulgaris*

1.b

## Hort urbà

## Diversify agricultural production and promote traditional cultivation and productive schemes

\_More diversification will increase **biodiversity**, so improving the adaptation capability of the landscape. It will also lead to improve **visual, olfactory and perceptive** landscape values.

\_They will allow to **save water and energy**, through the re-discovering of **traditional** productive schemes, that requires less water.

\_The introduction of local traditional and organic cultivation will decrease soil and water **pollution** level.

### Specific actions/activity proposals

\_Research development in order to find cultivations which develop more **slowly**;

\_enhance **communication** with expertise (Landscape Observatory, Academic Institutions) and **discussion** with involved stakeholders.

\_Specific intervention to recover the **agricultural architectural heritage** (masies and granges);

\_Strengthen **terraces cultivation** along the mountain;

\_Create a **coordination body** responsible for the management of agricultural waste for energy production;

\_Support **green building** using local materials (also from agricultural production)

2

Diversify agricultural production and promote traditional cultivation and productive schemes

2050

3

## Design a flood risk adaptation strategy

\_In order to face **flood risk** that will probably increase because of more **intense rainfall** period. A proper strategy would allow to collect water for agricultural uses.

### Specific actions/activity proposals

\_Design a system of canals to decrease flood risk and to direct overflowed water into a **capillary irrigation system**;

\_Insert **water-resisting vegetation** in the fluvial-agricultural **buffer-zone**.

\_Find vegetal species that limit soil erosion and **sediment transportation** risk

3

## Design a flood risk adaptation strategy

flood risk

intense rainfall

irrigation system;

water-resisting vegetation

capillary

buffer-zone.

sediment transportation

## 4

### Set up adaptive forest management

\_In order to face the uncontrolled increase of forest surface (already 74,4% of the total surface), it is necessary to manage it. Considering the **increasing fire risk**, it is also necessary to think at specific interventions. Within the energy crisis, the forest could be a potential source for **non-fossil energy** production.

### Specific actions/activity proposals

\_establish a forest **management procedures**, based on **local stewardship**;

\_insert **break-fire zones**, which can also be used as pasture areas

\_increase forest use for energetic purposes, by strengthening **biomass** production;

\_enhance **discussion** with private land owners

4

## Set up adaptive forest management

4

Els arbres, a Olot, inoblidables i potser constitueixen l'essència del seu paisatge.

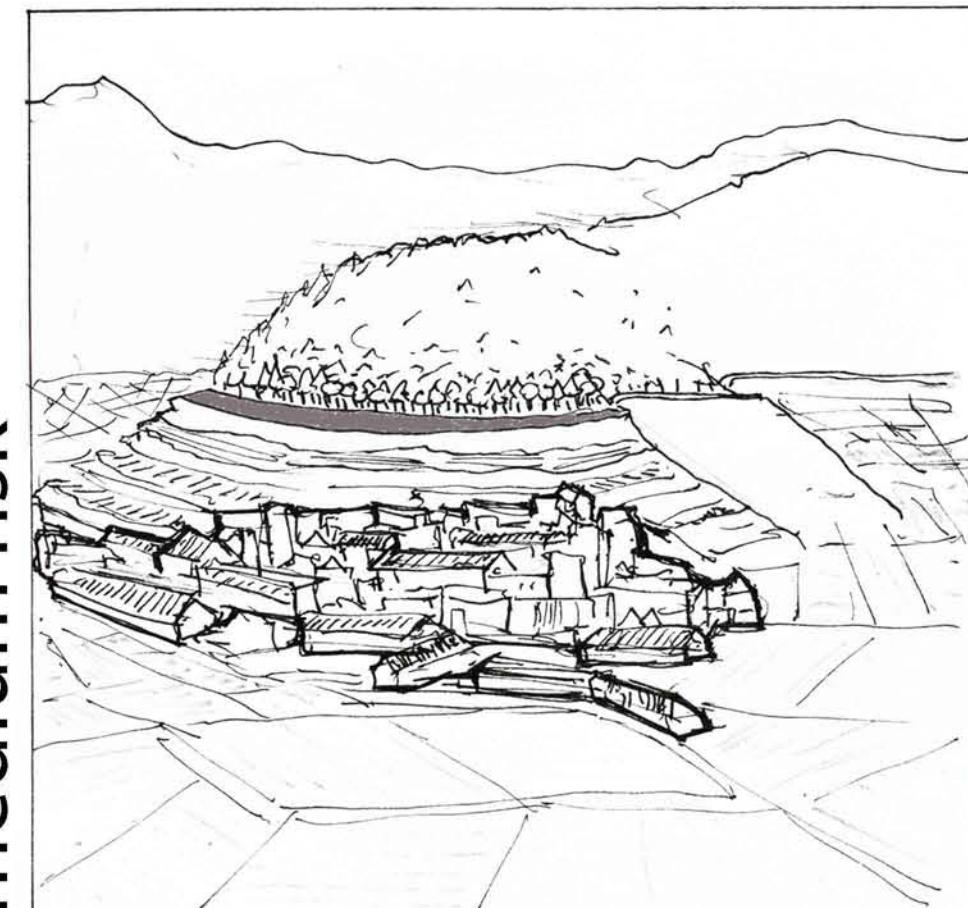

The trees, in Olot, are unforgettable and they constitute the essence of the landscape.

Josep Pla, 1968
